Graph

Many problem in graph

Graph (review)

Definition. A directed g
- a set V of vertices
- a set E ⊆ V × V of edges.

In an undirected graph G = (V, E), the edge set E consists of unordered pairs of vertices.

In either case, we have |E| = O(V²). Moreover, if G is connected, then |E| >= |V| − 1, which implies that lg |E| = Θ(lg V). (Review CLRS, Appendix B.)

Cartesian product of two sets that used to creat order pairs.

A X A, A X B.
- any subset over Cartesian product gives you something we call relati
  Cartesian product: A X B
  Relation: S ⊆ A X B
- each connection each ordered pair is an edge and then that gives us t

Edge set is simply a sub set of the Cartesian product of the vertex sets amo

Graph representation:

Adjacency-matrix representation

The adjacency matrix of a graph G = (V, E), where V = {1, 2, ..., n}, is the matrix A[1 . . n, 1 . . n] given by

Adjacency-matrix representation

Adjacency-list representation

Adjacency-list representation

An adjacency list of a vertex v ∈ V is the list Adj[v] of vertices adjac
- Need to go through the list to check if the member exist in the list.

$Adj[1] = \{2, 3\}$
$Adj[2] = \{3\}$
$Adj[3] = \{\}$
$Adj[4] = \{3\}$

For undirected graphs, $|Adj[v]| = degree(v)$.
For digraphs, $|Adj[v]| = out\text{-}degree(v)$.

Handshaking Lemma: $\sum_{v \in V} degree(v) = 2|E|$ for undirected graphs ⇒ adjacency lists use $\Theta(V + E)$ storage — a *sparse* representation.
- if you add up all the degrees for all the vertices then what you should be getting is precisely twice the size of the headset
- Running time: summation of degrees
- Prove: by observation. Be add one edge twice: one time for each direction.

➢ Adjacency-list saves space!

Party Hand shaking problem
For each handshake, two people will report that hand shake

Minimum spanning trees

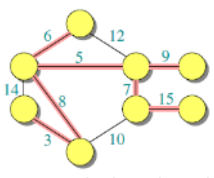
Minimum spanning trees

Input: A connected, undirected graph G = (V, E) with weight function w : E→**R**.
- For simplicity, assume that all edge weights are distinct. (CLRS covers the general case.)

Output: A spanning tree T — a tree that connects all vertices — of minimum weight:

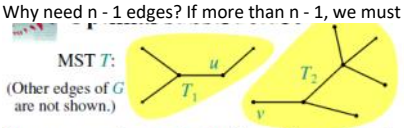
$$w(T) = \sum_{(u,v) \in T} w(u, v)$$

Example of MST



- The outputted subgraph mush be a tree

- Why need n - 1 edges? If more than n - 1, we must have a cycle.



Remove any edge $(u, v) \in T$. Then, T is partitioned into two subtrees T_1 and T_2.

Theorem. The subtree T_1 is an MST of $G_1 = (V_1, E_1)$, the subgraph of G *induced* by the vertices of T_1:

V_1 = vertices of T_1,
$E_1 = \{ (x, y) \in E : x, y \in V_1 \}$.

Similarly for T_2.

Claim:

- T1 must be a MST in the graph G1
- T2 must be a MST
  - G = G1 U G2? FA
  - We are creating s that connecting G

https://eduassistpro.github.io/

Prove: copy-and-phase

Proof. Cut and paste:

$w(T) = w(u, v) + w(T_1) + w(T_2)$.

If T_1 were a lower-weight spanning tree than T_1 for G_1, then T' = (u, v) + T_1' + T_2 would be a lower-weight spanning tree than T for G. □

Assignment Project Exam Help

Do we also have overlapping subproblems?

- Yes.

Great, then dynamic programming may work!

- Yes, but MST exhibits another (powerful) property which leads to an even more efficient algorithm.

Greedy Algorithm

Greedy-choice property: A locally optimal choice is globally optimal.

Greedy for MST

Theorem. Let T be the MST of $G = (V, E)$, and let $A \subset V$. Suppose that $(u, v) \in E$ is the least-weight edge connecting A to $V - A$. Then, $(u, v) \in T$.

Assignment Project Exam Help

Add WeChat edu_assist_pro

- Purple edges: A; red edges: V - A. Or vice versa
- Proof by contradiction
  1. Suppose the lest weight edge (that goes from purple to red) is **not** part of the MST
  2. Let T be a MST, and u, v has the smallest edge that not part of the MST (dash line). Suggesting these is must be an unique single path that goes from u to v.
  3. Contradiction

Note that we have assumption the "all weight of edges are distinct". To expand the theorem to a graph containing equally weighted edges, we change "this edge must be part of the optimal solution" to "it must be part of an optimal solution".

Prim's algorithm

Prim's Algorithm

IDEA: Maintain $V - A$ as a priority queue Q. Key each vertex in Q with the weight of the least-weight edge connecting it to a vertex in A.

$O(v)$ total
$Q \leftarrow V$
$key[v] \leftarrow \infty$ for all $v \in V$
$key[s] \leftarrow 0$ for some arbitrary $s \in V$
$|V|$ times
while $Q \neq \varnothing$
degree(u) times
do $u \leftarrow$ EXTRACT-MIN(Q)
for each $v \in Adj[u]$
do if $v \in Q$ and $w(u, v) < key[v]$
then $key[v] \leftarrow w(u, v)$ ▷ DECREASE-KEY
$\pi[v] \leftarrow u$

update neighbor

At the end, $\{(v, \pi[v])\}$ forms the MST.

Handshaking Lemma $\Rightarrow \Theta(E)$ implicit DECREASE-KEY's.

Time = $\Theta(V) \cdot T_{\text{EXTRACT-MIN}} + \Theta(E) \cdot T_{\text{DECREASE-KEY}}$

- The extract min gives the least cost edge from red vertices to purple vertices
- If the edge weights are not distinct, it can be still unique, but not necessarily unique.

Analysis of Prim

Analysis of Prim

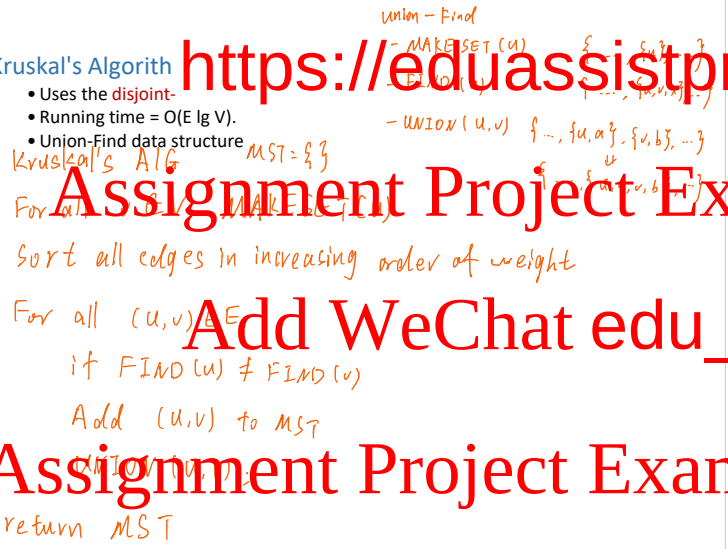
$$\text{Time} = \Theta(V)\cdot T_{\text{EXTRACT-MIN}} + \Theta(E)\cdot T_{\text{DECREASE-KEY}}$$

Q	$T_{\text{EXTRACT-MIN}}$	$T_{\text{DECREASE-KEY}}$	Total
array	$O(V)$	$O(1)$	$O(V^2)$
binary heap	$O(\lg V)$	$O(\lg V)$	$O(E \lg V)$
Fibonacci heap	$O(\lg V)$ amortized	$O(1)$ amortized	$O(E + V \lg V)$ worst case

Kruskal Algo

Kruskal's Algorith

- Uses the disjoint-
- Running time = O(E lg V).
- Union-Find data structure



Recent Algo

Best to date:

- Karger, Klein, and Tarjan [1993].
- Randomized algorithm.
- O(V + E) expected time.
