Matching problem

Flow network $G = (V, E)$ with two distinguished vertices: a source s and a sink t . Each edge $(u, v) \in E$ has a nonnegative capacity $c(u, v)$. If $(u, v) \notin E$, then $c(u, v) = 0$.

The flow goes into the vertex should equal to the flow goes out from that vertex

Add WeChat edu_assist_pro

- The flow should not have any "leaks"

Flow conservation (like Kirchoff's current law):

- Flow into u is $2 + 1 = 3$.
- Flow out of u is $0 + 1 + 2 = 3$.

The value of this flow is $1 - 0 + 2 = 3$.

- The positive flow is not greater than the capacity
 - Flow conservation: in == out
 - Sink vertex doesn't need to have flow conservation
 - The nature of the problem: at some edges we are wasting our capacity
- Find the maximum assignment

Maximum-flow problem: Given a flow network G , find a flow of maximum value on G .

➤ The value of the maximum flow of the above graph is 4.

Flow cancellation

Equivalence of definitions

Theorem. The two definitions are equivalent.

Proof. (\Rightarrow) Let $f(u, v) = p(u, v) - p(v, u)$.

• **Capacity constraint:** Since $p(u, v) \leq c(u, v)$ and $p(v, u) \geq 0$, we have $f(u, v) \leq c(u, v)$.

• **Flow conservation:**

$$\begin{aligned}\sum_{v \in V} f(u, v) &= \sum_{v \in V} (p(u, v) - p(v, u)) \\ &= \sum_{v \in V} p(u, v) - \sum_{v \in V} p(v, u)\end{aligned}$$

• **Skew symmetry:**

$$\begin{aligned}f(u, v) &= p(u, v) - p(v, u) \\ &= -(p(v, u) - p(u, v)) \\ &= -f(v, u).\end{aligned}$$

• If given a network flow, can we create a flow that satisfies its two properties

lemma 1

lemma 2

lemma 3

conservation of flow

- Whatever we send to the network should end up in the sink

Cuts

Definition. A cut (S, T) of a flow network $G = (V, E)$ is a partition of V such that $s \in S$ and $t \in T$. If f is a flow on G , then the **flow across the cut** is $f(S, T)$.

$$f(S, T) = (2 + 2) + (-2 + 1 - 1 + 2) = 4$$

- Split the graph to two side: source to one side, and sink to another side

Another characterization of flow value

Lemma. For any flow f and any cut (S, T) , we have $|f| = f(S, T)$.

Proof.

$$\begin{aligned}
 f(S, T) &= f(S, V) - f(S, S) \\
 &= f(S, V) \\
 &= f(s, V) + f(S-s, V) \\
 &= f(s, V) \\
 &= |f|. \quad \square
 \end{aligned}$$

Residual network

Definition. Let f be a flow on $G = (V, E)$. The **residual network** $G_f(V, E_f)$ is the graph with strictly positive **residual capacities**

$$c_f(u, v) = c(u, v) - f(u, v) > 0.$$

Edges in E_f admit more flow.

Example:

Lemma. $|E_f| \leq 2|E|$. □

Augmenting paths

<https://eduassistpro.github.io/>

- The graph above is not entire graph, therefore there are some node without conservation int the network flow

Assignment Project Exam Help

Max-flow, min-cut theorem

Theorem. The following are equivalent

1. f is a maximum flow.
2. f admits no augmenting paths.
3. $|f| = c(S, T)$ for some cut (S, T) .
